

Backgrounds, by surface

All variants stay inside the same chart vocabulary: hairline grid, mustard waypoint accents, mono labels, dark warm-black base. What changes is the subject the chart is plotting. Space and orbits for the operational surfaces. Surface survey for the LFG board.

Sector Chart

What this is: tactical sector view. Stronger grid, three waypoints connected by solid and dashed routes, a hatched contested zone, distance and bearing call-outs. Reads as a current operational picture rather than astronomy.

Jump Corridor

What this is: wide system map. Four named systems sit at chart positions with halo glows, hairline jump corridors connect them with diamond jump-point markers at midpoints, and a compass rose anchors the orientation. Reads as a strategic overview rather than a single mission.

Surface Survey

What this is: planet-side surface map. Topographic contour lines with elevation labels, a dashed claim boundary marking a mining operation (AURUM-3), industrial symbol set (ore clusters, gem markers, pickaxes for work orders), a red hatched hostile zone with two attack reticles, three numbered friendly waypoints, supply-line dashes between them, and a map scale bar. Supports both industrial and combat LFG copy on the same canvas.

VARIANT F

LANDING • FLEET COMMAND • WILD OPS

Pyro System

What this is: Pyro system in chart form. Red-giant central star with a wider, warmer halo. Broken asteroid debris rings instead of clean orbits, peppered with debris dots. Five named Pyro planets including Terminus with its contested Ruin Station. Three outlaw stations marked with diamond rests (Endgame, Checkmate, Rat's Nest). A "no UEE jurisdiction" warning runs along the bottom. Uses the rust accent #9C4A22 to mark Pyro as visibly different from the disciplined Stanton variants.

VARIANT G

ASTEROID BASE DETAIL • RALLY POINT ALT

Levski • Delamar

06 • NOTES

FOR DECISION

Working notes

Family. All five variants stay on the same chart base (dark warm-black, hairline grid, mustard accents at low opacity, mono labels). The grammar changes; the toolkit doesn't.

How loud is a background? Each variant here is rendered at "preview brightness" so you can see what's in it. Production opacity should drop another 20-30 percent so content sits on top cleanly. The mustard waypoint accents should be the brightest thing on the canvas, and even those should sit under any active UI element.

What I'd flag.

- Variants A and B are space-flight in vocabulary. A reads as a stable plot; B reads as an active course. Hub probably wants A (welcoming); Fleet Command wants B (operational).
- Variant C is the most "tactical" of the space set. Could go on Fleet Command if you want it to feel busier, or stay reserved for specific dashboard surfaces.
- Variant D works at landing and high-level surfaces where the strategic-overview feel adds to the welcome.
- Variant E is the only variant using red signal color (for hostile zones and attack reticles). Worth deciding whether to keep that on the surface or pull it back to mustard-only with a different mark for hostile.
- Real space backgrounds in apps need to be careful with stars over text. We can keep all of these but tile them with stronger top/bottom fades when implemented, so star density drops in the header and footer zones where text lives.
